

# Installation Guide for Wood Paneling

## 1. Site Preparation

The wall must be stable, dry, and level. All dimensions must be double-checked and compared to the layout plan.

## 2. Tools & Materials

Drill, screwdriver, adhesive, level, miter saw, tape measure, mounting clips, provided plans and parts list.

## 3. Installation Process

- Mount the horizontal rail at base height (check for level)
- Start paneling from the center and work outward symmetrically
- Fix panels with clips, screws, or glue depending on the system
- Trim profiles to fit (miter cuts) and install
- Cut openings for sockets or heating niches as needed
- Final adjustments and surface check

## 4. Surface Treatment

Depending on the client's request: raw, oiled, lacquered, waxed, or patinated. Finishing may take place in the workshop or on site.

## 5. Heritage Projects

Reversibility must be ensured. Do not glue onto historic plaster. Always consult with conservation specialists.

## 6. Safety Notice

Only certified professionals may alter electrical or heating systems. DIY installation is done at the customer's own risk.
